

Today's Lab Session Task 1:

Using an example of the knapsack problem, explain that the greedy solution can be much worse than the optimal solution (i.e., the total profit of a greedy solution can be smaller than $1/100$ of the total profit of the optimal solution). You need to create an example.

Today's Lab Session Task 2:

Using an example of the TSP problem, explain that the greedy tour length can be more than two times of the optimal tour length. You need to create an example.

Today's Lab Session Task 3:

Using an example of the load balancing problem, explain that the greedy makespan can be almost the same as two times of the optimal makespan. You need to create an example.
